----------	---------------------------	----------

LSMTool is a Python package which allow the manipulation of sky models in the `makesourcedb` format understood by BBS. Note that LSMTool is still in beta. Please report bugs to `drafferty@hs.uni-hamburg.de`. To initialize your environment for LSMTool, users on CEP1 and CEP2 should run the following commands:

```
use LofIm
source ~/rafferty/init_lsmtool
```

Note that the Pythonlibs LOFAR package includes an older version of `astropy` that conflicts with LSMTool and cannot be used in conjunction with it.
